STING FREE VOLLEYBALL INFLATION INSTRUCTIONS:

When inflating the sting free volleyball, please have an air gauge available to prevent over inflation. This ball should not be inflated more than 1.5 psi. This is enough pressure to expand the bladder and remove any wrinkles in the outer fabric. If any wrinkles remain in the cover, over inflate to flatten the surface and then remove the excess air until you reach the recommended 1.5 psi.

If this ball is left over inflated it will weaken the seams on the outer fabric and could result in the panels separating. The ball must be inflated to these specifications to keep the 1 year warranty valid.
